

**ITI**

# **Introduction to Computer Networks & Cyber Security**

**Prepared By : Mohamed AboSehly**

## **Part 2 (Cyber Security Essentials)**

# **Cyber Security Essentials**

# Part 2 (Cyber Security Essentials)

- **Session Outlines**
  - **Information Security Goals**
    - Confidentiality ,Integrity, Availability
  - **Risks & Threats**
    - Threats & Vulnerabilities
    - Attackers methodology & Methods
    - Malware Types
  - **Security Defenses**
    - Firewalls (Static & Dynamic firewalls)
    - IDS /IPS
    - VPN
    - Proxy
    - Next generation Firewalls
  - **Encryption**
    - Symmetric & Asymmetric Key Cryptography
    - Digital Signatures /Digital Certificates

## Part 2 \_Introduction

- People use networks to exchange sensitive information with each other.
- People purchase products and do their banking over the Internet.
  - We rely on networks to be secure and to protect our identities and our private information
- Cyber Security is a shared responsibility that each person must accept when they connect to the network.

## Part 2 \_Cyber Security

- **Cyber Security**
  - How to protect systems, networks, programs, devices and data from cyber attacks
- **Network security** is the implementation of security devices, policies, and processes to **prevent the unauthorized access to network resources** or the alteration or destruction of resources or data.
- **Security involves protecting resources:**
  - **End-user resources:** PCs, Laptop, Tablets
  - **Network resources:** Routers, Switches
  - **Server resources:** Rack Mount, Blade servers

## Part 2 \_Security Goals

**C . I . A**

## Part 2 \_Security Goals

- **Confidentiality**

- Ensuring that information is not revealed to unauthorized persons
- Data transmitted or stored should only be revealed to an intended audience

- **Integrity**

- Ensuring **consistency** of data
- It should be possible to detect any modification of data

- **Availability**

- Ensuring that legitimate users are not denied access to information and resources

## Part 2 \_Focus of Security is Risk

- Security deals with managing risk to your critical assets
- It's **impossible** to totally eliminate risk
- Security 99.9 % Not found Why ?
  - This can be seen through the different types of attacks that users face today.
  - New technologies / applications
  - New Vulnerabilities
  - the difficulties in defending against these attacks

$$\text{Risk} = \text{Threat} \times \text{Vulnerabilities}$$

**Vulnerability** is the degree of weakness which is found in every network and device.

**Threats** is A person, thing, event or idea which poses danger to **an asset** in terms of that asset's confidentiality, integrity, availability or legitimate use

## Part 2 \_Attackers Terminologies

- **Black hats**

- Individuals with extraordinary computing skills, resorting to malicious or destructive activities.
- Known as '**Crackers.**'

- **White Hats**

- Individuals professing hacker skills and using them for defensive purposes.
- Known as 'Security Analysts, **Ethical hacker**'.

- **Gray Hats**

- Individuals who work both offensively and defensively at various times.

## Part 2 \_What does a Malicious Hacker Do?

- Reconnaissance
- Scanning
- Gaining access
- Maintaining access
- Covering tracks

## Part 2 \_Reconnaissance (Phase 1)

- Reconnaissance refers to the preparatory phase where an **attacker seeks to gather as much information as possible about a target** of evaluation prior to launching an attack.
- Gathering info about internal structure of organization, by browsing and search the internet

Instagram

## Part 2 \_ Scanning (Phase 2 )

- Scanning refers to pre-attack phase when the **hacker scans the network with specific information gathered during reconnaissance.**
- Scanning for **open ports, operating systems, applications, open shares,**

# Lab

- In your lab use A port scanner tools to find the open ports on your device

## Part 2 \_Gaining Access (Phase 3)

- Gaining Access refers to the true attack phase. The **hacker exploits the system.**
- The exploit can occur over a LAN, locally, Internet.
- Examples include buffer overflows, denial of service, session hijacking etc.

## Part 2 - Maintaining Access (Phase 4)

- Maintaining Access refers to the phase when the hacker **tries to retain his 'ownership' of the system.**
- Sometimes, **hackers harden the system from other hackers as well (to own the system).**

## Part 2- Covering Tracks(Phase 5)

- Covering Tracks refers to the activities undertaken by the hacker to extend his misuse of the system without being detected.
- Reasons include need for continued use of resources, removing evidence of hacking, avoiding legal action etc.
- Hackers can remain undetected for long periods.

## Part 2 \_Attacks

Attack is any attempt to destroy, expose, alter, disable, steal or gain unauthorized access to or make unauthorized use of an asset

## Part 2 \_Attack Types

- Passive Attack
- Active Attack
- Phishing Attack
- Hijack Attack
- Spoof Attack
- Buffer Overflow Attack
- Exploit Attack
- Password Attack

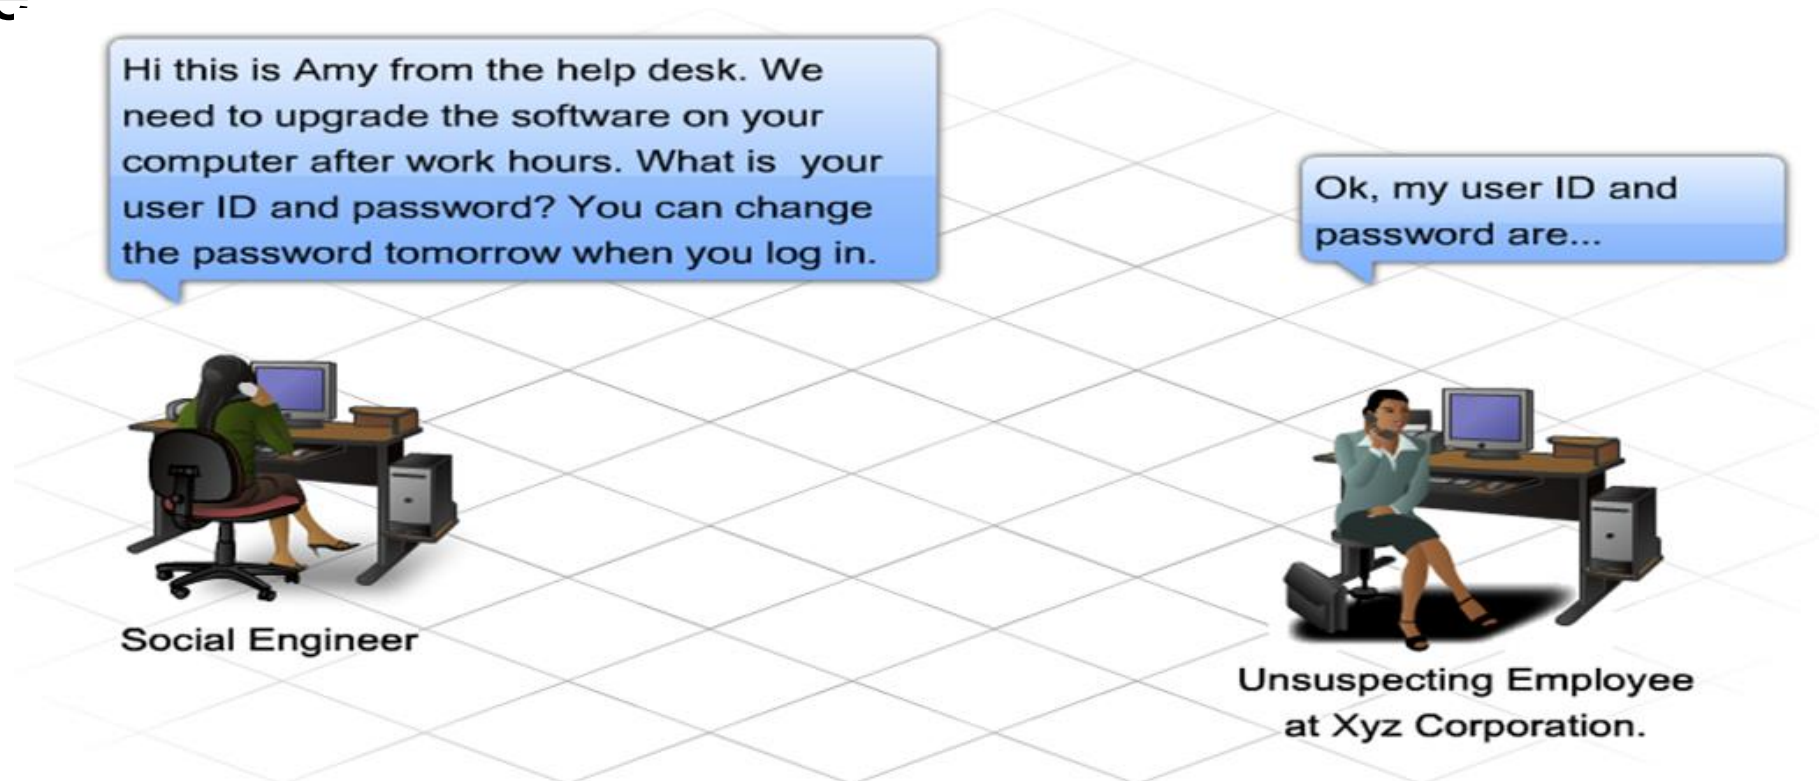

## Part 2\_Passive attack VS Active attack

- **Passive attack** attempts to take the information from the system and **does not affect any system resources and its operations.**
  - Ex : Cookies , Spyware , Wireshark
- **Active attack** attempts to **change** the system resources or affect their usual operations.
  - Ex : Ransomware, Viruses, worms

## Part 2\_ Social engineering

- **Social engineering** is a term that refers to the ability of something or someone to influence the behavior of a group of people

# Part 2\_PHISHING ATTACK

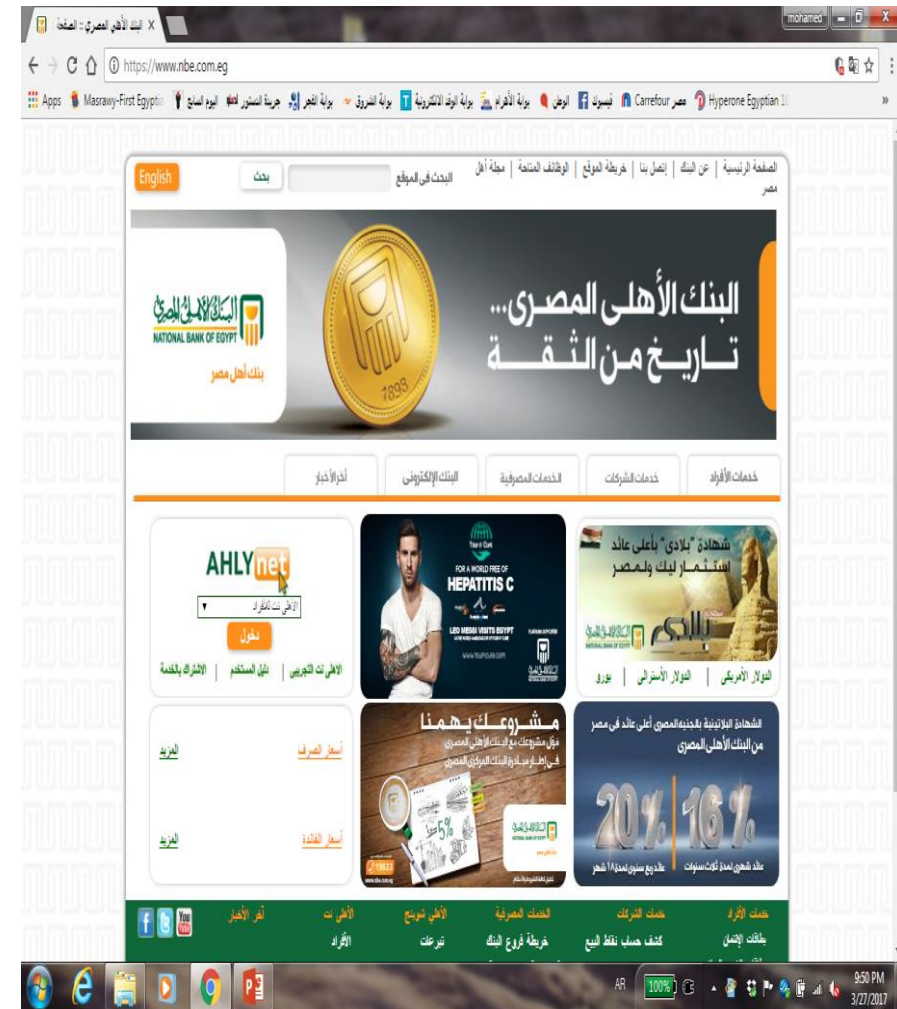

## In phishing attack

- the hacker creates a fake web site that looks exactly like a popular site.
- The phishing part of the attack is that the hacker sends
  - An e-mail message , Sms message
- trying to trick the user into clicking a link that leads to the fake site.
  - When the user attempts to log on with their account information, the hacker records the username and password and then tries that information on the real site.

# Part 2\_Find the fake one ?

# Part 2\_Insider Attack

## Part 2\_HIJACK ATTACK

In a **hijack attack**, a hacker **takes over a session** between **you and another individual** and **disconnects the other individual from the communication**. You still believe that you are talking to the original party and may send private information to the hacker by accident.

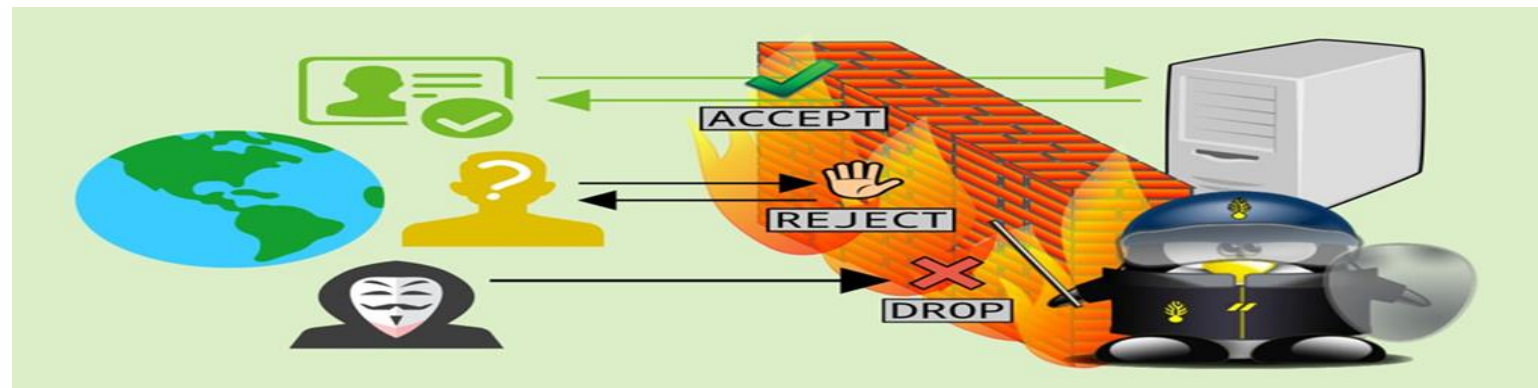

## Part 2\_SPOOF ATTACK

In a **spoof attack**, the hacker **modifies** the source address of the packets he or she is sending so that they **appear to be coming from someone else**. This may be an attempt to **bypass your firewall rules**.

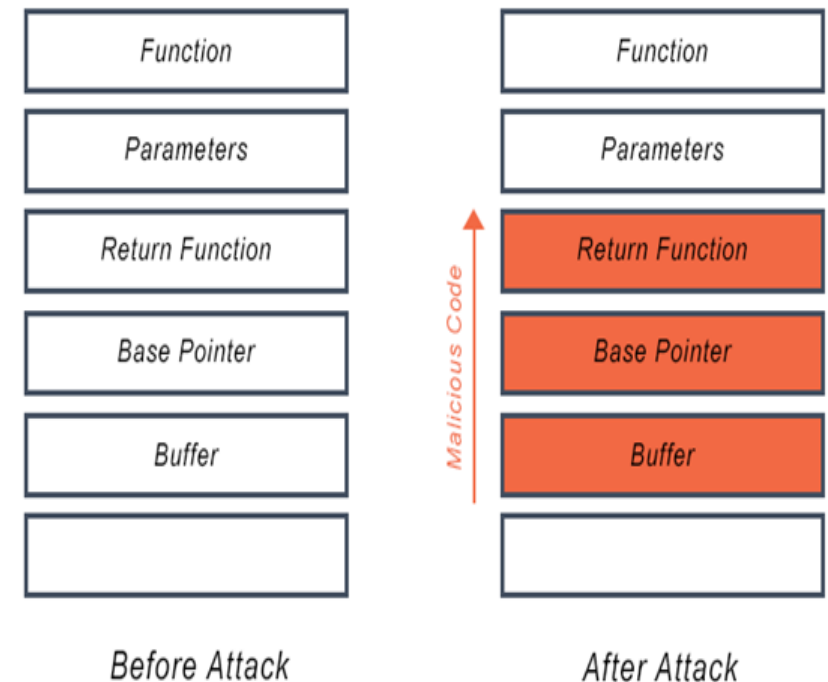

# Part 2\_BUFFER OVERFLOW ATTACK

A **buffer overflow** attack is when the **attacker sends more data to an application than is expected**. A buffer overflow attack **usually results in the attacker gaining administrative access to the system in a command prompt or shell**.

Buffer Overflow Attack

## Part 2\_PASSWORD ATTACK

An attacker tries to crack the passwords stored in a network account database or a password-protected file.

# Part 2\_types of password attack

- Dictionary attack
- Brute-force attack
- Hybrid attack.

Login

username

password

login

[Lost your password?](#)

## Part 2\_types of password attack

- A **dictionary attack** uses a **word list file**, which is a list of potential passwords.

## Part 2\_TYPES OF PASSWORD ATTACK

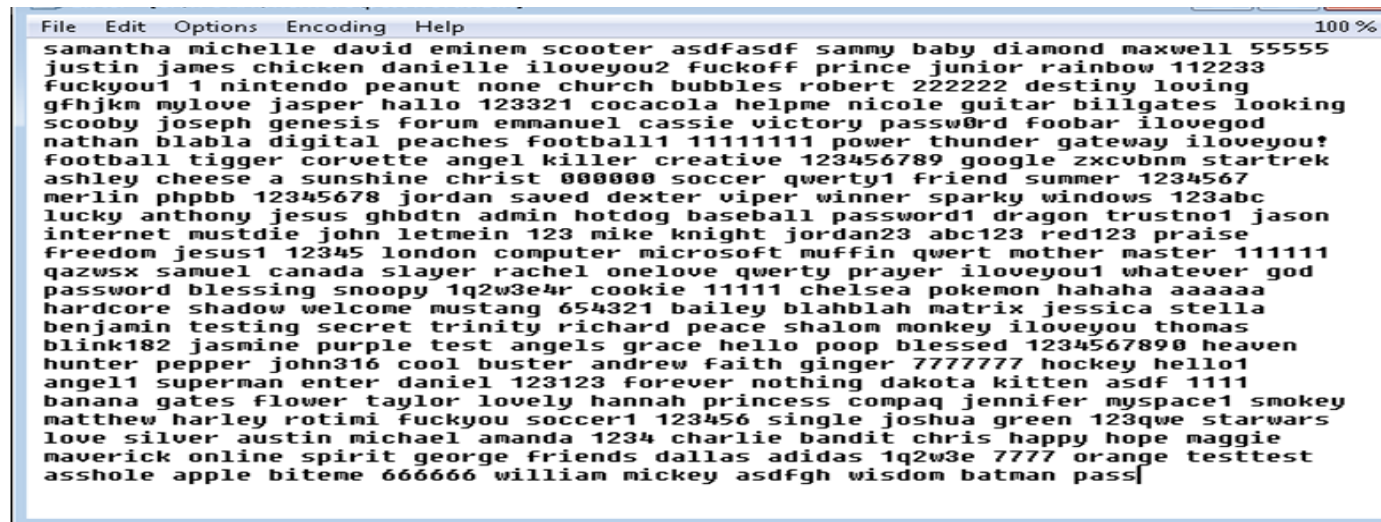

- A **brute-force attack** is when the attacker tries **every possible combination of characters**.

# Part 2\_types of password attack

- A **hybrid attack** builds on the **dictionary attack** method by adding numerals and symbols to dictionary words

# Part 2\_Malware Types

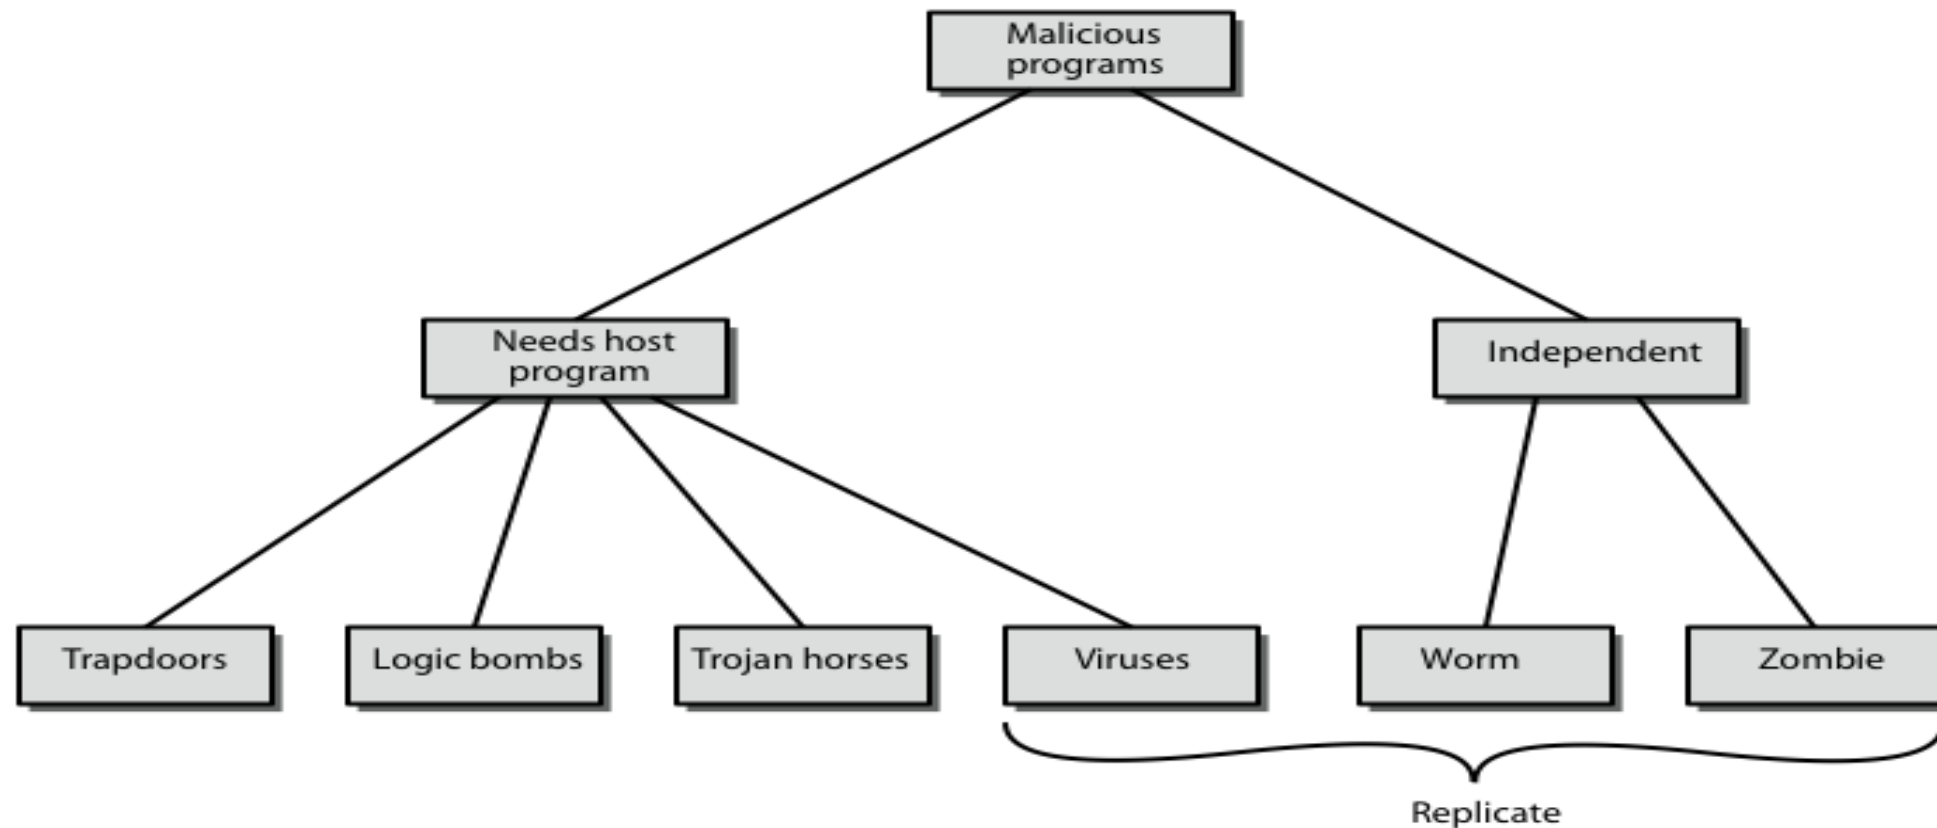

## ■ Malware Capabilities

- Destruction of Data
- Leaking Confidential Information
- Providing Backdoor Access
- Countless Other Opportunities

## Part 2\_Malicious Software

## Part 2\_Backdoor or Trapdoor

- Secret entry point into a program
- Allows those who know access bypassing usual security procedures
- Have been commonly used by developers
- Requires good s/w development & update
- Can't be removed or scanned and the only way is to uninstall sw or format the system

## Part 2\_Viruses

- A virus is malicious software that is attached to another program to execute a particular unwanted function on a user's workstation.
- Both propagates itself & carries a payload
  - Carries code to make copies of itself
  - As well as code to perform some covert task

## Part 2\_Trojan Horse

- program with hidden side-effects
- which is usually superficially attractive
  - eg game, software upgrade etc
- when run performs some additional tasks
  - allows attacker to indirectly gain access they do not have directly
- often used to propagate a virus/worm or install a backdoor or simply to destroy data
- Open some ports or pass some malicious files

## Part 2\_ Independent malware

- Worms
- Zombie
- Man in the middle
- DOS
- DDOS
- Spyware and Tracking Cookies

## Part 2\_Worms

- Replicating but **not infecting** program
- Typically spreads over a network
- Using users distributed privileges or by exploiting vulnerabilities
- Widely used by hackers to create **zombie pc's**, used for further attacks, especially dos
- Major issue is lack of security of permanently compromised systems

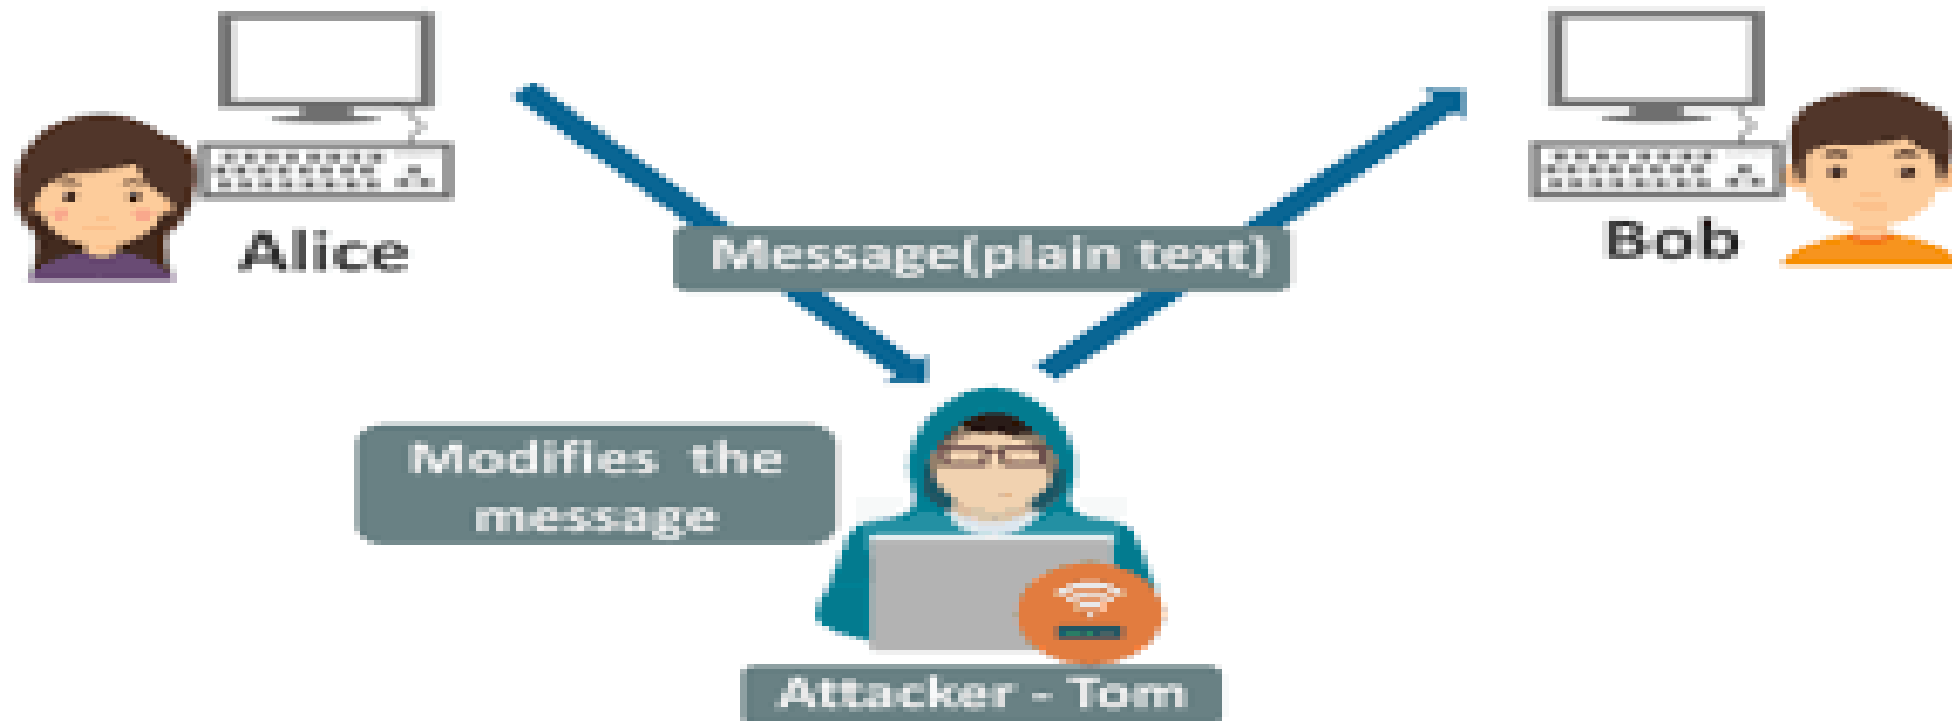

## Part 2\_Zombie

- Program which secretly takes over another networked computer then uses it to indirectly launch attacks
- Often used to launch distributed denial of service (DDoS) attacks

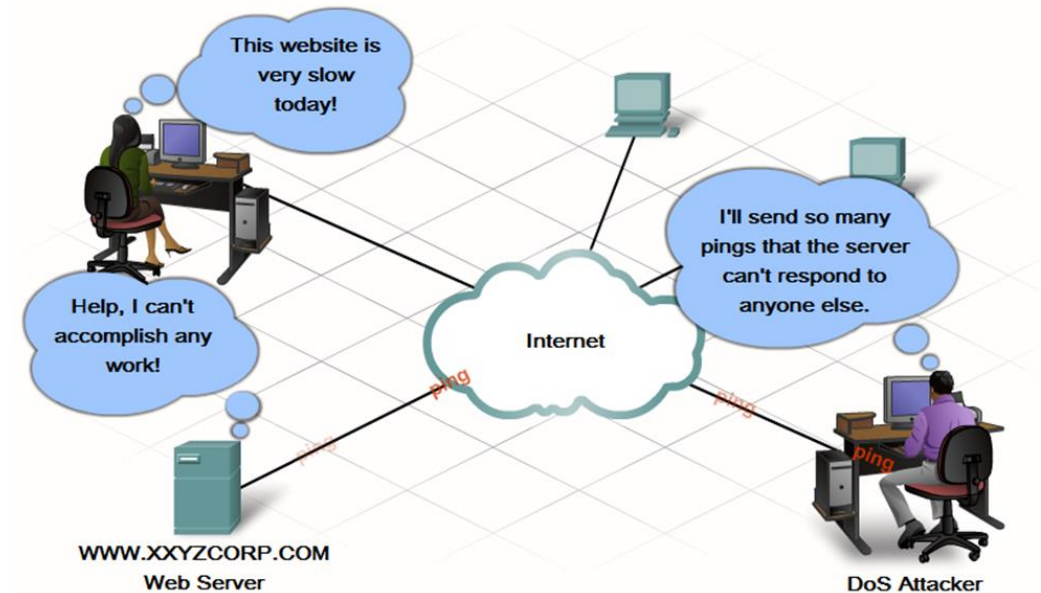

## Part 2\_Man in the middle Attack

## Part 2\_DoS Attack

- Denial of service is about without permission knocking off services, for example through crashing the whole system.
- This kind of attacks are easy to launch and it is hard to protect a system against them.
- Consume host resources
  - Memory
  - Processor cycles
- Consume network resources
  - Bandwidth

## Part 2\_DDoS Attack

- **DDoS** – A distributed denial of service attack uses multiple machines to prevent the legitimate use of a service.
- Making networked systems unavailable by flooding with useless traffic using large numbers of “zombies” growing sophistication of attacks

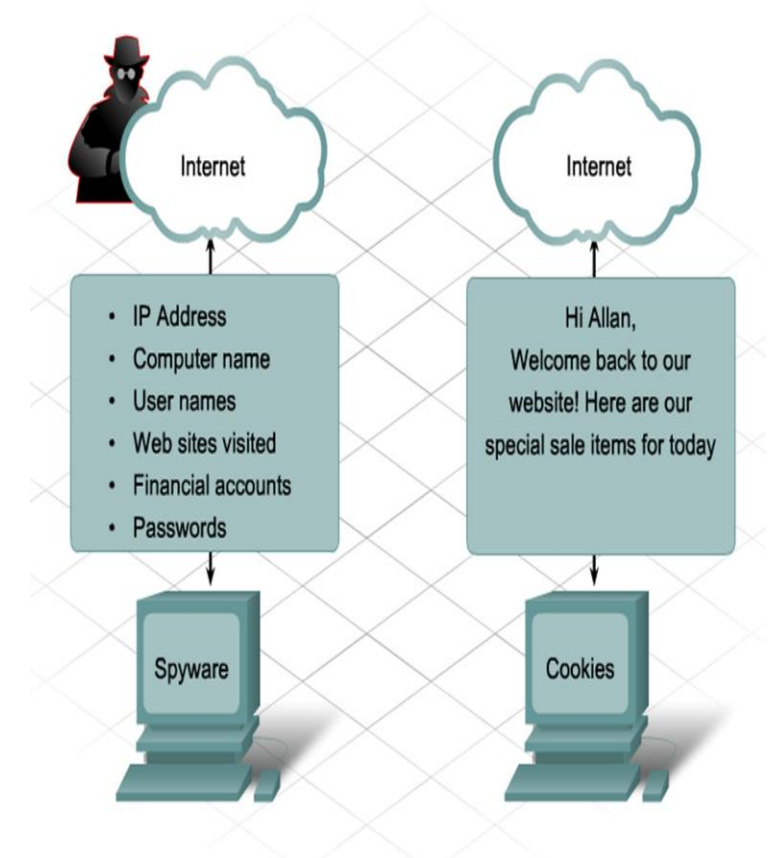

# Part 2\_Spyware and Tracking Cookies

- **Spyware**

- Spyware is any program that gathers personal information from your computer **without your permission or knowledge**. This information is **sent to advertisers or others** on the Internet and can include passwords and account numbers.

- **Tracking Cookies**

- Cookies are a **form of spyware** but are **not always bad**. They are used to record information about an Internet user when they visit websites.

## Part 2\_Spam

- **Spam**
- is a serious network threat that can overload ISPs, email servers and individual end-user systems.
- A person or organization responsible for sending spam is called a spammer.
- Spammers often make use of unsecured email servers to forward email.
- Spammers can use hacking techniques, such as viruses, worms and Trojan horses to take control of home computers.

**Thank You**
